An clogged vent could also be the reason why the dryer is not drying out. The towel fuse is blown (fan wheel) your Maytag hairdryer is provided with a couple of safety characteristics designed to prevent possible damage to the machine or even prevent a fire in the house. Install the new cut and put the screw back and connect the wires on the new one. Further information on automatic dryers in this quick guide. The first thing you need to do is remove the dryer from the wall and make sure it is disconnected and the drain tube is disconnected. Once you have an easy access to the rear of the dryer, use the dio äina driver to remove all the screws from the rear cover. Then clean the screen with soap and water to remove the accumulation of residues: wet both sides of the screen with hot water. Try the dryer to be sure you start to warm up as it should do. Connect the cable to the exit and hook the drain tube and put the dryer back in her normal place and test. Then, using the DADO driver ä ç Äina, remove the screw keeping the thermostat in position. To carry out this repair, you want to buy the thermal cut kit for the dryer first. The vent system plays an important role in keeping the air in motion and can be responsible if your dryer does not dry well. Place the thermostat in the same position on the new and tighten the screw again. Once you have the new Hi-Limit thermostat in hand, the replacement is really easy to make. Make sure the vent tube is the shortest possible with not more than four curves of 90 ä Ä °. Using a flat-tip screwdriver to blow up the two wires that are connected to the terminals of the old fuse. Remove the old heat fuse and install the new and put the screw on the place and tighten it. Along with heat, heat, you need a good air flow to do the job. Empty Lint and debris from both the extremes of the vent tube, to the entire length. Identify the heating element unit at the bottom of the dryer. A vent pipe should have at least 4 "in diameter for the maximum air flow. Put the access cover back and tighten all screws.) One of the most common causes of the dryer, not the heating is that the thermal cut is defective. Put the two access coverage and serve all the screws that are used to keep the roofs in position. Don. T stacking the dryer. Attack the two wires on the terminals of the new fuse (it doesn't matter which thread it connects To which terminal). Then using the diors from the äina throw driver remove the single screw that keeps it in position. In this case, the repair is quite simple and you can order a new Maytag thermal fuse and replace it alone. Fortunately, this It is something that a home owner can replace with some basic tools. You will have to disconnect the two cables connected to the thermostat using the Punta Punta screwdriver. Disconnect the thread that use the screwdriver of With a flat tip, then remove the two screws that keep the heating element in position. Connect the power cord and hook the drain tube and test the dryer. The 45 curves will provide an even better air flow. Remove the dryer from the wall to have free access to the rear access panel. Turn it on to test and check if it heats up. Remove the hands rolling it with your fingers. Once the replacement heating element is received, the repair should not require, but only some time to be made. The last thing you need to do is put the access lines and tighten all screws. It is called hairdryer and is designed close the heater circuit in case of an overheating condition. overheating.To know the drying cycles in the owner's manual. Disconnect from the exit and remove the exhaust pipe. Follow this link to get a part once you have the new fuse to replace the old one with you will only have a few tools; Dart driver and a flat-point screwdriver. Follow this link to get a part if you determine that the heating element is actually bad and should be replaced You can contact Maytag and request a replacement heating element. With the removed screws, pull down on the unit of the heating element and remove it completely from the dryer. Repairs should be simple enough for someone with some DIY skills and the right tools for work. Look behind the dryer to ensure that the vent pipe is made of heavy and rigid material. First, make sure the machine is disconnected from the output and the exhaust pipe is disconnected. Follow the same procedure to remove the old thermostat and then put the lid back. Once you have the covers, you will need to locate the old Hi-Limit thermostat which is mounted on the heating element unit at the bottom of the dryer. Reconnect all the wires you disconnected on the new heating element. Remove the drain from the outside of the house. Make sure the dryer is on the level. Below are the four most common causes for this and simple repair. Rub the screen. So, if at some point you find that the dryer timer turned off and your clothes aren't dry or suspect that you've never heated first. Extract the drive so you have a lot in space to get to the back access panel. Call the dryer manufacturer for help. Put it aside andThe old thermal fuse. Delete the objects in front of the dryer. Using the Dado driver to remove all the screws on the rear access lid. To do it, remove the single screw that keeps the thermostat in position and remove it. It should be positioned in the lower part of the drilled fan wheel.
